

SECTION 1

CASES

[The only part we keep]

This is the start of a lot of material. The cartridge case, in one way of looking at it, is probably the least important factor in accuracy. (Oh boy.) Good bullets and coincidentally superior load ingredients are the preeminent factors in group sizes. But the cartridge case probably gets talked about and picked apart and, no question about this one, worked on more than any other ammunition element. That's what nearly all those tools we have are for. One reason is that it's the one we can do something to, it's the malleable component. The other parts of the loaded round, more or less, are what they are. The case, though, we can whittle, drill, shape, file, fix, and even shine.
